🍕 Pizza Sales Dashboard - Power BI & MySQL

This project is a comprehensive sales analysis dashboard for a pizza business, built using **MySQL** for database management and **Power BI** for visualization. The dashboard provides key insights into sales trends, order patterns, and top-performing products.

📌 Project Overview

1. **Database Creation in MySQL**
    - Created a relational database in **MySQL** and imported a CSV dataset.
    - Encountered a challenge where the **date format** in the CSV did not match MySQL's expected format.
    - Resolved the issue by formatting the date correctly and successfully imported the data.
2. **Data Exploration with SQL**
    - Wrote multiple **SQL queries** to analyze key metrics, such as:
        - Total Revenue
        - Total Pizzas Sold
        - Total Orders
        - Average Order Value
        - Sales Trends by Category, Size, and Time Period
    - Extracted meaningful insights and exported the processed data.
3. **Power BI Dashboard Creation**
    - Connected **MySQL Server** to **Power BI**.
    - Designed an interactive **two-page dashboard** with:
        - **Page 1:** High-level sales overview with revenue, orders, and trends.
        - **Page 2:** Best & worst-selling pizzas based on revenue, quantity, and orders.

📊 Key Insights from the Dashboard

- **Total Revenue: $817.86K**
- **Total Orders: 21,350**
- **Total Pizzas Sold: 49,574**
- **Average Order Value: $38.31**
- **Best-selling Pizza: Brie Carre Pizza**
- **Least-selling Pizza: Brie Carre Pizza** (by revenue), **Spinach Supreme Pizza** (by quantity)

🔥 Sales Trends

- **Peak Sales Days: Fridays & Saturdays (evenings)**
- **Best Sales Months: July & January**
- **Top Category: Classic Pizzas (26.91% of total sales)**
- **Best-Selling Size: Large (45.89% of sales)**

🚀 Technologies Used

- **MySQL** – For database creation & query execution
- **SQL Queries** – For data extraction & analysis
- **Power BI** – For data visualization & dashboard development

🔗 Future Improvements

- Automate data updates for real-time insights.
- Integrate customer feedback data for better analysis.
- Optimize SQL queries for faster performance.
